                                                       1
                                                           1
                      1
## IL.6
                            1
                                               1
                                                       1
                                                           1
                1
                      1
                                 1
                                         1
## IL.13
                1
                            1
                                 1
                                         1
                                               1
                                                       1
                                                           1
                      1
## IL.10
                1
                      1
                            1
                                               1
                                                       1
                                                           1
# to check each column with imputed data
## igf$imp$IFNy
#Now we can get back the completed dataset using the complete()
complete_genes <- complete(igf, 1)</pre>
\#sapply(complete field, function(x) sum(is.na(x)))
#visualize missingness
vis dat(complete genes)
## Warning: `gather_()` was deprecated in tidyr 1.2.0.
## i Please use `gather()` instead.
## i The deprecated feature was likely used in the visdat package.
```

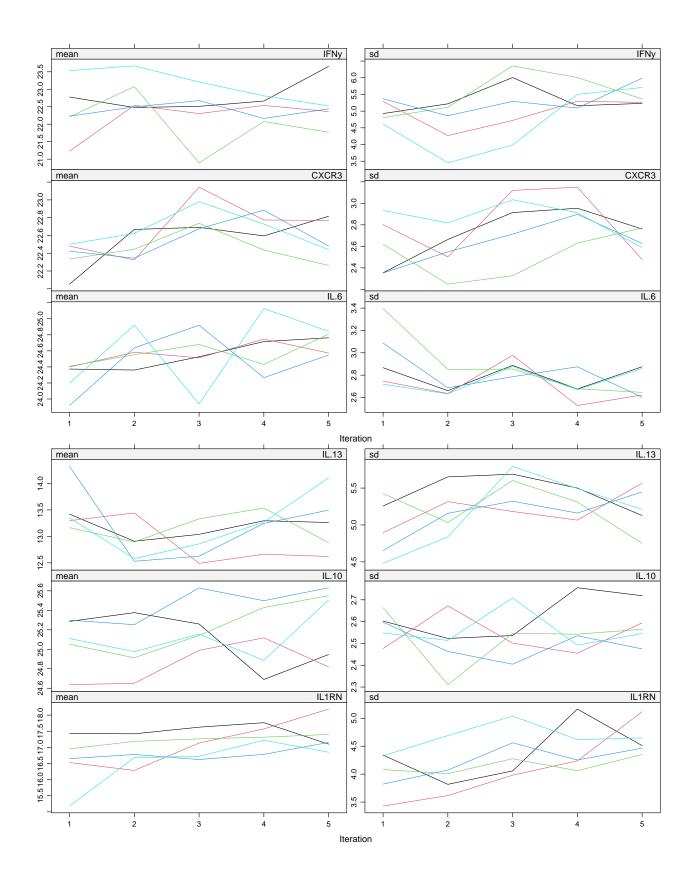

MYD88

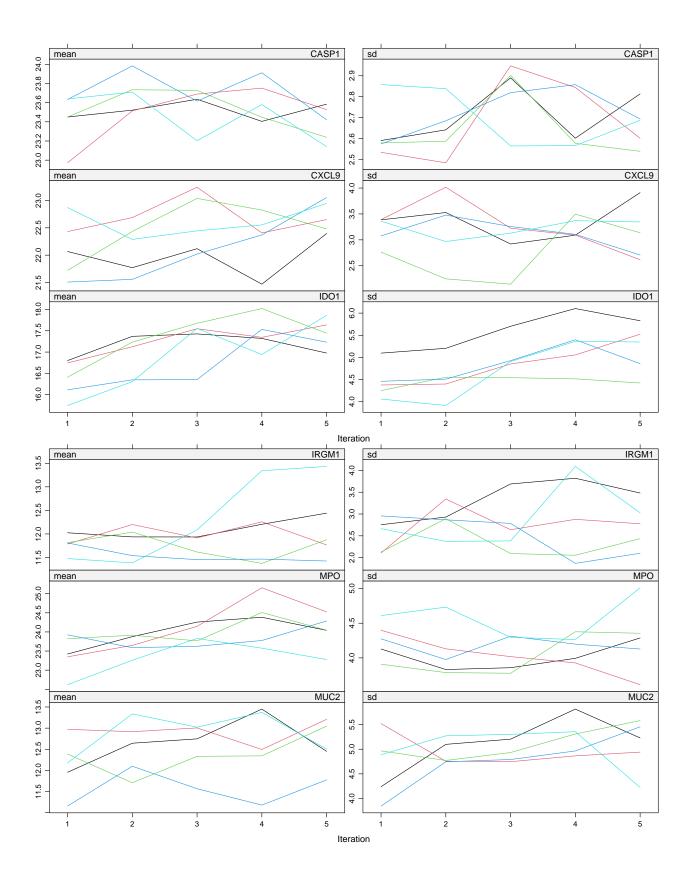

Please report the issue at https://github.com/ropensci/visdat/issues>.

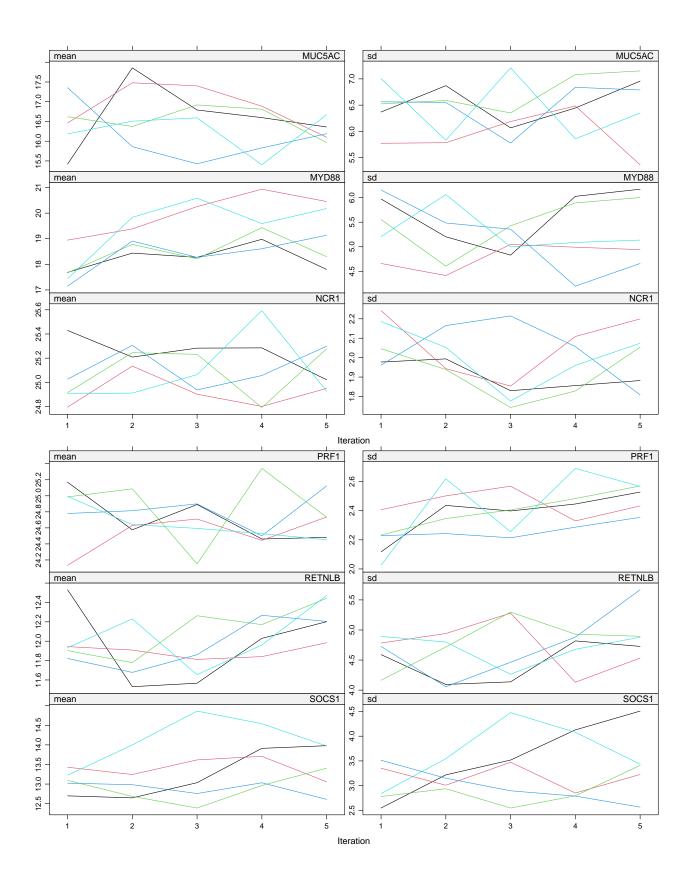

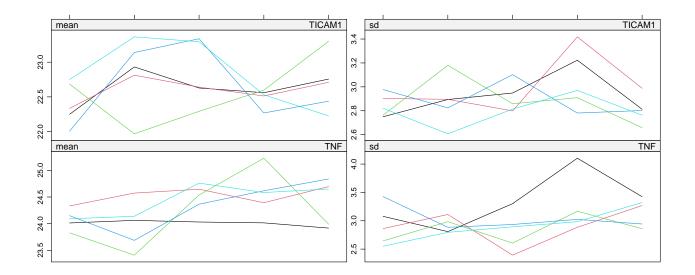

inspect the trace lines for convergence:

plot(igf)

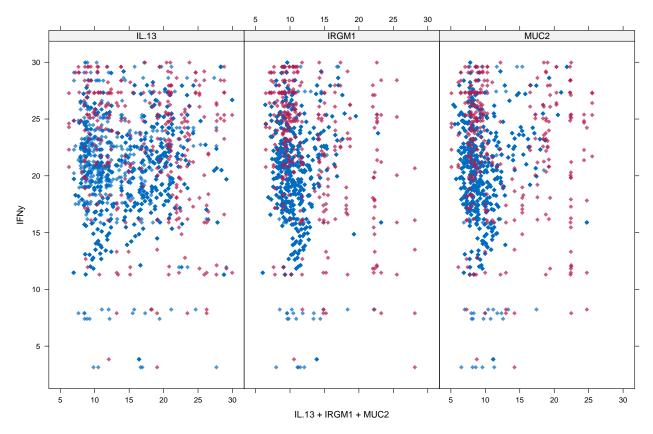

Iteration

Let's compare the distributions of original and imputed data using a some useful plots. First of all we can use a scatterplot and plot Ozone against all the other variables. Let's first plot the variables for which we have few missing values.

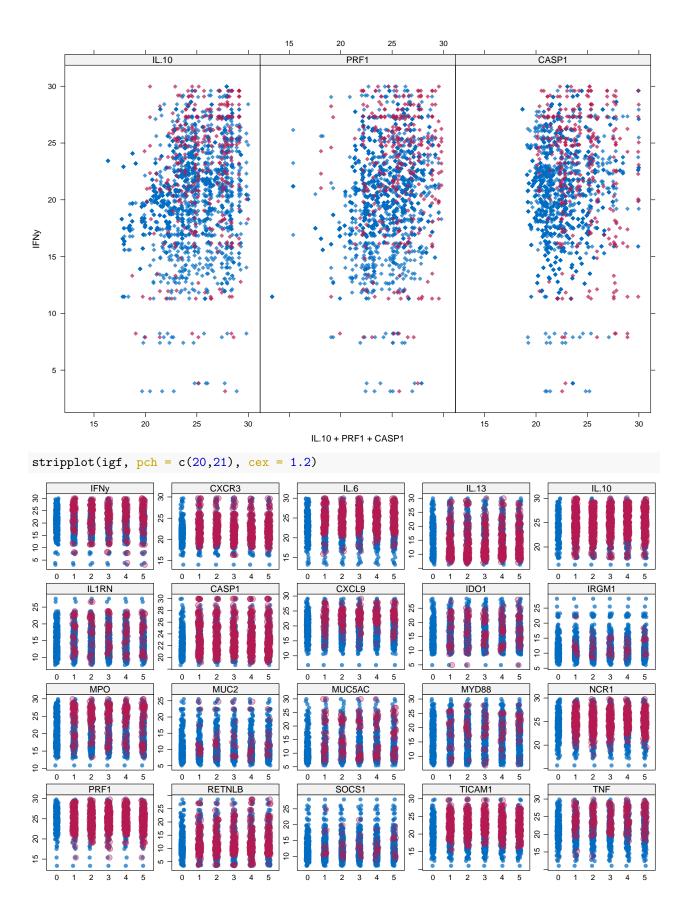

```
xyplot(igf, IFNy ~ IL.13 + IRGM1 + MUC2, pch=18,cex=1)
```

What we would like to see is that the shape of the magenta points (imputed) matches the shape of the blue ones (observed). The matching shape tells us that the imputed values are indeed "plausible values".

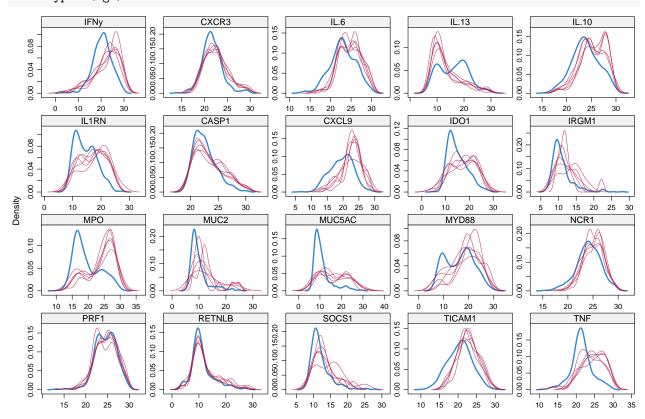

Now let's plot the variables with many missing data points.

```
xyplot(igf,IFNy ~ IL.10 + PRF1 + CASP1, pch=18,cex=1)
```

#bwplot(igf)

densityplot(igf)

The density of the imputed data for each imputed dataset is showed in magenta while the density of the observed data is showed in blue. Again, under our previous assumptions we expect the distributions to be similar.

Another useful visual take on the distributions can be obtained using the stripplot() function that shows the distributions of the variables as individual points

Facs

```
facs_mouse <- facs_mouse[row.names(facs_lab), ]</pre>
##select same rows in the first table
lab <- lab[row.names(facs_mouse), ]</pre>
##############Field
#######field
# somehow the field samples have the origin na,
# fix that
field <- hm %>%
 dplyr::filter(origin == "Field")
field <- unique(field)</pre>
facs_mouse <- field %>%
 dplyr::select(c(Mouse_ID, all_of(Facs_wild)))
facs_field <- facs_mouse[,-1]</pre>
#remove rows with only nas
facs_field <- facs_field[,colSums(is.na(facs_field))<nrow(facs_field)]</pre>
#remove colums with only nas
facs_field <- facs_field[rowSums(is.na(facs_field)) != ncol(facs_field), ]</pre>
##select same rows in the first table
field <- field[row.names(facs_field), ]</pre>
facs_data <- full_join(lab, field, by = intersect(colnames(lab), colnames(field)))</pre>
facs_data <- unique(facs_data) %>%
  dplyr::select(-c("IFNy", "CXCR3", "IL.6", "IL.13", "IL.10",
                "IL1RN", "CASP1", "CXCL9", "ID01", "IRGM1", "MP0",
                "MUC2", "MUC5AC", "MYD88", "NCR1", "PRF1", "RETNLB", "SOCS1",
                "TICAM1", "TNF"))
```

Now put everything togetehr

```
hm_selection_g <- hm_selection_g %>%
  full_join(facs_data, by = intersect(colnames(facs_data), colnames(hm_selection_g)))
hm_selection_g <- unique(hm_selection_g)

##save the imputed data
write.csv(hm_selection_g, "output_data/2.imputed_MICE_data_set.csv", row.names = FALSE)</pre>
```
